ABUZZ FUZZ DISORDER DEER 混乱

Located inside the pedal, there is a small trimpot that allows you to set the initial input gain of the effect. This process will not break the warranty.

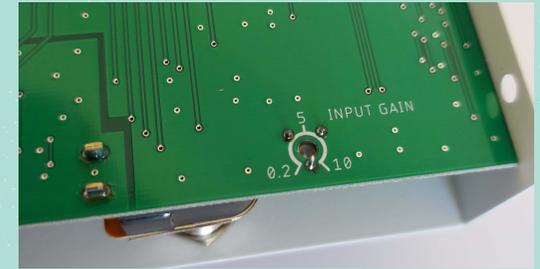

To gain access :

With a HEX M11 nut driver
remove the back jack nuts

With a philips PH1 screwdriver
remove the 4 side bolts

Using a small flat screwdriver
set the initial gain of the pedal.

To set the gain correctly, there are two methods. The choice of method depends on your playing style.

Method A

If you like to keep the fuzz level down for low gain sounds, power up the pedal and set it as following:

FILTER= 50% SENSE = 0% RESON = 0% FUZZ = 0% LEVEL = 50%

Be careful not to touch the green PCB area or any other visible vias on the PCB. Hold the pedal's enclosure on the sides if you have to.

Now play your guitar (or any other instrument). Your goal is to set the gain so that your signal gets slightly distorted.

Of course, you are free to set it up any way that sounds better for you, the above is just a suggestion.

Method B

If you like the fuzz levels to be extreme, power up the pedal and set it as following:

FILTER= 50% SENSE = 0% RESON = 0% FUZZ = 100% LEVEL = 50%

Be careful not to touch the green PCB area or any other visible vias on the PCB. Hold the pedal's enclosure on the sides if you have to.

Now do not play your guitar, but keep its strings muted with your hand. Find the point where the gain allows some random noise elements to pass, even with your guitar muted. Then set the trimpot exactly before those noise elements appear.

Of course, you are free to set it up any way that sounds better for you, the above is just a suggestion.
